Board 903V

The Board 903 V is the same game camera control board used in the 903V Brain Unit. Stable and reliable, the Board 903V is the ideal controller for 35mm and workable digital cameras. Able to control cameras in the on-off mode as well as the stay on of certain Olympus models, the Board 903V has the versatility sought by today's game camera home builder. Four sensitivity settings add to that versatility. With a very energy efficient design, the Board 903V will operate off a single 9 volt battery for in excess of 4 months.

The Board 903V has at its heart a PIC micro controller programmed by Brian Gennings, offering 9 timer delays and day-night-both functions.

Below is a picture of the Board 903V as it is sold.

With the Pushbuttons and Sensitivity adjustment separate from the board, the camera builder has the flexibility many desire to be able to design your

own enclosure, and not to be locked in to positioning the function controls in inconvenient locations.

While we supply a Fresnel Technologies WAO.9GI Fresnel Lens with the Board 903V, a 0.6 LOTIFF lens may be substituted at a small additional cost.

Standard timer delays are as follow:

*10 seconds
30 seconds
1 minute
3 minutes
5 minutes
10 minutes
20 minutes
30 minutes
1 Hour*

Custom timer delays are available upon request for a \$3.00 fee to cover shipping for the custom chip. This will also cause some time delays in shipping the board.

For On-Off mode applications with the Sony P32, 52, 31, and 51 there is an Adjustable Sequencing function to make allowances for potential small timing differences between cameras.

For Stay on Mode applications and 35mm, the adjustable refresh times are programmed in as follows:

*2.5 minutes
2.5 hours
7 minutes*

Custom refresh times are available upon request for a \$3.00 fee to cover shipping for the custom chip. This will also cause some time delays in shipping the board.
